

Watcher

Keep an eye on the ones you care about

Problem

- **Unrestricted Entry & Exit:** Traditional flap doors.
- **Prey & Disease Transmission:** Free-roaming pets frequently bring wildlife prey (birds, rodents) inside, exposing households to parasites, pathogens, and zoonotic diseases.
- **Lack of Behavioral Insights:** Pet owners have limited visibility into their pets' daily indoor/outdoor habits, routines, or changes in activity that could signal health issues.
- **Security & Supervision:** Leaving doors or windows open creates security vulnerabilities and increases the risk of unsupervised pet escape.

Problem

- **Unrestricted Entry & Exit:** Traditional flap doors at home
- **Prey & Disease Transmission:** My cat brings in weird dead or alive mice from outside
- **Lack of Behavioral Insights:** I don't know where my cats go when I'm away or asleep
- **Security & Supervision:** Doors at home aren't locked so easy access to leave

Solution

- **Automated Door/Window Mechanism:** An automatic locking door that restricts or permits pet access dynamically based on system rules.
- **AI Computer Vision Detection:** Real-time object identification (Cats, Dogs, Humans) detecting activity near entry points before opening.
- **Prey Detection & Prevention:** Monitors incoming pets to prevent them from bringing captured prey inside the home.
- **Affordable IoT Hardware:** Powered by cost-effective microcontrollers (ESP32), standard sensors, and live WebRTC camera feeds—making smart pet security accessible.

Market Validation

Global Pet Monitoring
is a **\$3.4+ billion**
market

North America has
37% to 51% of total
market

Product

- **Live Video Streaming:** Integrated WebRTC camera feed to observe window and flap areas in real time.
- **Dynamic Access Rules:** Inbound Only, Outbound Only, Two-Way Access
- **Real-Time Event Summary:** An activity log recording detections

LLM as a tool

- **Writing code and Wiring:** Arduino code quickly identifying ESP32 pin types.
- **Configuring Media MTX Server and Client:** Hosted in AWS worked with VPC and EC2.

Business Model

Hardware Purchase: \$150 (*One-time upfront cost*)

- Entry-level price point designed to disrupt the high-cost electronic door market (\$250–\$650 ASP).
- Includes the ESP32 control hub, sensor array, lock mechanism, and camera stream integration.

Monthly Subscription: \$10 – \$15 / month (*Recurring revenue*)

- **Included Value:** Cloud-based AI prey detection models, WebRTC live streaming storage, instant push alerts, and long-term behavioral analytics.

Customer Lifetime Value (LTV): High margin potential—a customer staying subscribed for 2 years generates **\$390 – \$510 total revenue** per unit.

Next steps

- Printed circuit board(PCB)
- Optimize video transmission
- Used a dedicated camera

Thank you!
